## SOLUTIONS :

A mixture of two or more substances can be a solution. We can also say that a solution is a homogeneous mixture of two or more substances 'Homogeneous' means 'uniform throughout'. Thus a homogeneous mixture, i.e., a solution, will have uniform composition throughout.

### 1. CONCENTRATION TERMS:

The following concentration terms are used to express the concentration of a solution. These are :

- |                       |                   |
|-----------------------|-------------------|
| 1 . Molarity (M)      | 2 . Molality (m)  |
| 3 . Mole fraction (x) | 4 . % calculation |
| 5 . ppm               |                   |

\* Remember that all of these concentration terms are related to one another. By knowing one concentration term you can also find the other concentration terms. Let us discuss all of them one by one.

**1.1. Molarity (M):** The number of moles of a solute dissolved in 1 L (1000 ml) of the solution is known as the molarity of the solution.

$$\text{That is, Molarity of solution} = \frac{\text{number of moles}}{\text{volume of solution in litre}}$$

Let a solution is prepared by dissolving  $w$  g of solute of mol. wt.  $M$  in  $V$  mL water.

$$\therefore \text{Number of moles of solute dissolved} = \frac{w}{M}$$

$$\therefore V \text{ mL water have } \frac{w}{M} \text{ mole of solute}$$

$$\therefore 1000 \text{ mL water have } \frac{w \times 1000}{M \times V(\text{in mL})} \Rightarrow \therefore \text{Molarity (M)} = \frac{w \times 1000}{(\text{Mol. wt of solute}) \times V(\text{in mL})}$$

Some other relations may also useful.

$$\text{Number of millimoles} = \frac{\text{mass of solute}}{(\text{Mol. wt. of solute})} \times 1000 = (\text{Molarity of solution} \times V_{\text{ml}})$$

$$\text{Molarity of solution may be also given as: } \frac{\text{Number of millimole of solute}}{\text{Total volume of solution in ml}}$$

Molarity is a unit that depends upon temperature. It decreases as temperature increases.

**Ex.1** Find the mass of solute and solvent in 100 mL, 1 M NaOH solution having density 1.5 g/mL.

- (A) 40 g, 110 g      (B) 4 g, 150 g      (C) 4 g, 146 g      (D) 40 g, 150 g

**Ans.** (C)

**Sol.** Mole of NaOH = molarity  $\times$  volume (l) =  $1 \times 0.1 = 0.1$

$$\text{Mass of NaOH} = 0.1 \times 40 = 4\text{gm}$$

$$\text{Mass of solution} = \text{volume} \times \text{density} = 100 \times 1.5 = 150\text{gm}$$

$$\text{Hence: mass of solvent} = 150 - 4 = 146 \text{ g.}$$

**Ex.2** Molality of pure water if its density is 0.936 gm/ml

- (A) 50 (B) 55.56 (C) 57.56 (D) 56.56

**Ans.** (B)

**Sol.**  $m = \frac{1000}{\text{M.W.}} = \frac{1000}{18} = 55.56$

**1.2 Molality (m) :** The number of moles of solute dissolved in 1000 g (1 kg) of a solvent is known as the molality of the solution.

That is,  $\text{molality} = \frac{\text{number of moles of solute}}{\text{mass of solvent in gram}} \times 100$

Let y g of a solute is dissolved in x g of a solvent. The molecular mass of the solute is m. Then y/m mole of the solute are dissolved in x g of the solvent. Hence

$$\text{Molality} = \frac{y}{m \times x} \times 1000$$

**Ex.3** 225 gm of an aqueous solution contains 5 gm of urea. What is the concentration of the solution in terms of molality. (Mol. wt. of urea = 60)

**Ans.** 0.332.

**Sol.** Mass of urea = 5 gm

Molecular mass of urea = 60

$$\text{Number of moles of urea} = \frac{5}{60} = 0.083$$

Mass of solvent = (255 – 5) = 250 gm

$$\begin{aligned} \therefore \text{Molality of the solution} &= \frac{\text{Number of moles of solute}}{\text{Mass of solvent in gram}} \times 1000 \\ &= \frac{0.083}{250} \times 1000 = 0.332. \end{aligned}$$

**Ex.4** A solution is made by dissolving CaBr<sub>2</sub> in water (solvent) such that mass fraction of solute and solvent is same in the solution. The molality of solution is -

- (A) 2.5 m (B) 55.55 m (C) 2 m (D) 5 m

**Ans.** (D)

**Sol.**  $m = \frac{w / 200 \times 1000}{w} = 5 \quad m = \frac{w / 200 \times 1000}{w} = 5$

### 1.3 Mole fraction (x):

The ratio of number of moles of the solute or solvent present in the solution and the total number of moles present in the solution is known as the mole fraction of substances concerned.

Let number of moles of solute in solution = n

Number of moles of solvent in solution = N

$$\therefore \text{Mole fraction of solute } (x_1) = \frac{n}{n + N}$$

$$\therefore \text{Mole fraction of solvent } (x_2) = \frac{N}{n + N} \quad \Rightarrow \text{also } x_1 + x_2 = 1$$

### 1.4 % Calculation: The concentration of a solution may also express in terms of percentage in the following ways.

(i) **% weight by weight (%w/w):** It is given as mass of solute present in per 100 g of solution.

$$\text{i.e. \% w/w} = \frac{\text{mass of solute in g}}{\text{mass of solution in g}} \times 100$$

[X % by mass means 100 g solution contains X g solute ;

$\therefore$  (100 – X) g solvent]

(ii) **% weight by volume (%w/V) :** It is given as mass of solute present in per 100 mL of solution.

$$\text{i.e. \% w/v} = \frac{\text{mass of solute in g}}{\text{volume of solution in mL}} \times 100$$

[X %  $\left(\frac{w}{V}\right)$  means 100 mL solution contains X g solute]

(iii) **% volume by volume (%V/V):** It is given as volume of solute present in per 100 mL solution.

$$\text{i.e. \% V/V} = \frac{\text{Volume of solute}}{\text{Volume of solution in mL}} \times 100$$

**Ex.5** 0.25 of a substance is dissolved in 6.25 g of a solvent. Calculate the percentage amount of the substance in the solution.

**Ans.** 3.8%.

**Sol.** wt. of solution = 0.25 + 6.25 = 6.50.

$$\text{so \% (w/w)} = \frac{0.25}{6.50} \times 100 = 3.8\%.$$

**Ex.6** 0.5 g of a substance is dissolved in 25 g of a solvent. Calculate the percentage amount of the substance in the solution.

**Ans.** 1.96

**Sol.** Mass of substance = 0.5 g

Mass of solvent = 25 g

$$\therefore \text{Percentage of the substance (w/w)} = \frac{0.5}{0.5 + 25} \times 100 = 1.96$$

$$1.5 \quad \text{Parts per million (ppm)} : \frac{\text{Mass of solute}}{\text{Mass of solvent}} \times 10^6 \cong \frac{\text{Mass of solute}}{\text{Mass of solution}} \times 10^6$$

**Do yourself-1:**

- Calculate the molarity when:  
 (a) 4.9 g H<sub>2</sub>SO<sub>4</sub> acid dissolved in water to result 500 mL solution.  
 (b) 2 gram-molecules of KOH dissolved in water to result 500 mL solution.  
 (A) (a) 0.1 M (b) 0.07 M (B) (a) 0.4 M (b) 4 M  
 (C) (a) 0.4 M (b) 0.07 M (D) (a) 0.1 M (b) 4 M
- Calculate the volume in litre of 0.1 M solution of HCl which contains 0.365 g HCl?  
 (A) 10<sup>-2</sup> L (B) 0.1 L (C) 1 L (D) 10 L
- What volume of a 0.8 M solution contains 100 millimoles of the solute?  
 (A) 80 mL (B) 125 mL (C) 125 L (D) 80 L
- Which of the following methods of expressing concentration of a solution is/are independent of temperature ?  
 (A) Molality (B) % w/w  
 (C) Mole fraction of solute (D) All of these
- 20 cm<sup>3</sup> of an alcohol is dissolved in 80 cm<sup>3</sup> of water. Calculate the percentage of alcohol in solution.
- Calculate the amount of 75% pure NaI required to prepare 5 litre of 0.5 M solution.  
 (A) 281.25 g (B) 500 g (C) 923.33 g (D) 519.375 g

**2. DILUTION AND INTERMIXING OF SOLUTIONS**

Dilution: Whenever a given solution of known concentration i.e. normality and molarity (known as standard solution) is diluted (adding solvent), the number of millimoles (or milli equivalents) of solute remain unchanged. The concentration of solution however changes. In such a case if :

M<sub>1</sub> = Mormality of original solution; V<sub>1</sub> = volume of original solution and

M<sub>2</sub> = normality of diluted solution; V<sub>2</sub> = total volume of diluted solution

Since the number of millimoles remains same,

$$\Rightarrow M_1 V_1 = M_2 V_2$$

**Ex.7** Calculate the resultant molarity of following:

- (a) 200 ml 1M HCl + 300 ml water                      (b) 1500 ml 1M HCl + 18.25 g HCl  
(c) 200 ml 1M HCl + 100 ml 0.5 M H<sub>2</sub>SO<sub>4</sub>                      (d) 200 ml 1M HCl + 100 ml 0.5 M HCl

**Ans.** (A) 0.4 M                      (B) 1.33 M                      (C) 1 M                      (D) 0.83 M.

**Sol.** (a) Final molarity =  $\frac{200 \times 1 + 0}{200 + 300} = 0.4 \text{ M}$ .

(b) Final molarity =  $\frac{1500 \times 1 + \frac{18.25 \times 1000}{36.5}}{1500} = 1.33 \text{ M}$

(c) Final molarity of H<sup>+</sup> =  $\frac{200 \times 1 + 100 \times 0.5 \times 2}{200 + 100} = 1 \text{ M}$ .

(d) Final molarity =  $\frac{200 \times 1 + 100 \times 0.5}{200 + 100} = 0.83 \text{ M}$ .

**Ex.8** The molarity of Cl<sup>-</sup> in an aqueous solution which was (w/V) 2% NaCl, 4% CaCl<sub>2</sub> and 6% NH<sub>4</sub>Cl will be:

- (A) 0.342                      (B) 0.721                      (C) 1.12                      (D) 2.18

**Ans.** (D)

**Sol.** Moles of Cl<sup>-</sup> in 100 ml of solution =  $\frac{2}{58.5} + \frac{4}{111} \times 2 + \frac{6}{53.5} = 0.2184$

Molarity of Cl<sup>-</sup> =  $\frac{0.2184}{100} \times 1000 = 2.184$ .

**Ex.9** How many milli-litres of 0.2 M AlCl<sub>3</sub> solution is required to precipitate all the Ag<sup>+</sup> from 45 ml of a 0.2 M AgNO<sub>3</sub> solution:

- (A) 15 ml                      (B) 30 ml                      (C) 45 ml                      (D) 60 ml

**Ans.** (A)

**Sol.**  $\text{AlCl}_3 + 3\text{AgNO}_3 \rightarrow 3\text{AgCl} \downarrow + \text{Al}(\text{NO}_3)_3$   
45 × 0.2 milli moles

$$\frac{1}{3} \times 45 \times 0.2 \text{ milli mol}$$

$$\frac{1}{3} \times 0.45 \times 0.2 = 0.2 \times V$$

$$\Rightarrow V = 15 \text{ ml}$$

**Ex.10** The specific gravity of a solution is 1.8, having 62% by weight of acid. It is to be diluted to specific gravity of 1.2. What volume of water should be added to 100 ml of this solution?

**Ans.** 300 mL

**Sol.** Let, to 100 ml of given acid solution (sp. gr 1.8) x ml. of water is added.

∴ the total volume of resulting solution

$$= (100 + x) \text{ ml}$$

∴ the total weight of resulting solution

$$= (100 + x) \times 1.2 \text{ gm.}$$

$$\text{weight of acid present in the given acid solution (per 100 ml)} = 100 \times 1.8 \times 0.62$$

∴ the amount of water present in 100 ml of given acid solution =  $1.8 \times 100 \times 0.38$

∴ total wt of acid present in the diluted solution =  $(100 + x) 1.2 - x - 180 \times 0.38$

$$= 1.8 \times 100 \times 0.62$$

∴  $120 + 0.2x = 180$  or  $x = 300$

∴ to lower sp. gravity of the given acid solution to 1.2, we are to add 300 ml of water per 100 ml of acid solution (sp gr. 1.2).

**Ex.11** How would you prepare exactly 3 L of 1 M NaOH solution by mixing proportions of stock solutions of 2.5 M NaOH and 0.4 M NaOH, if no water is to be used? Find the ratio of the volume ( $V_1/V_2$ ).

(A) 1 : 3

(B) 3 : 7

(C) 2 : 5

(D) Data insufficient

**Ans.** (C)

**Sol.**  $M_1V_1 + M_2V_2 = M_TV_T$

$$2.5 V_1 + 0.4 V_2 = 3 \times 1$$

$$2.5 V_1 + 0.4 (3 - V_1) = 3 \quad \Rightarrow 2.5 V_1 + 1.2 - 0.4 V_1 = 3$$

$$2.1 V_1 = 1.8$$

$$V_1 = \frac{1.8}{2.1} = \frac{6}{7}$$

$$V_2 = 3 - \frac{6}{7} = \frac{15}{7}$$

$$\frac{V_1}{V_2} = \frac{6}{7} \times \frac{7}{15} = 2 : 5$$

### 3. INTERCONVERSION OF CONCENTRATION TERMS:

#### Comprehension # (Q.51 to Q.52)

|            | Molarity(mol/L) | Molality(mol/Kg) | Density (g/mL) | Gram molecular mass of solute |
|------------|-----------------|------------------|----------------|-------------------------------|
| Solution-1 | a               | -                | $d_1$          | P                             |
| Solution-2 | -               | b                | $d_2$          | Q                             |
| Solution-3 | 1               | -                | 1.060          | 60                            |

Now answer the following questions :

**Ex.12** What is molality of solution-1 :

- (A)  $\frac{(1000 \times a)}{(1000 \times d_1) - aP}$  (B)  $\frac{1000 d_1}{1000 a - P}$  (C)  $\frac{a}{1000 d_1 - aP}$  (D) None of these

**Ans.** (A)

**Sol.** For solution 1 'a' moles of solute are present in 1000 ml of solution.

wt. of solution =  $1000 \times d_1$  g

wt. of solute =  $aP$  g

$$\text{So, Molality} = \left[ \frac{a \times 1000}{1000 \times d_1 - aP} \right]$$

**Ex.13** What is the molarity of solution-2 :

- (A)  $\frac{b \times d_2}{1000 + bQ}$  (B)  $\frac{b \times 1000 \times d_2}{1000 + bQ}$  (C)  $\frac{1000 \times bQ}{1000 + bd_2}$  (D) None of these

**Ans.** (B)

**Sol.** For solution 2 'b' moles of solute are present in 1000 g of solvent.

wt. of solution =  $1000 + bQ$

vol. of solution =  $\frac{1000 + bQ}{d_2}$

$$\text{Molality} = \frac{b \times 1000}{1000 + bQ} = \frac{b \times 1000 \times d_2}{1000 + bQ}$$

**Ex.14** The molarity of the solution containing 2.8% ( mass / volume ) solution of KOH is :  
(Given atomic mass of K = 39 ) is :

- (A) 0.1 M (B) 0.5 M (C) 0.2 M (D) 1 M

**Sol.** Weight of KOH = 2.8 gram

Volume of solution = 100 ml

$$M = \frac{2.8 \times 1000}{56 \times 100} = \frac{5}{49} = 0.5 \text{ M}$$

**Ex.15** What is the mole fraction of ethanol in 20% by weight solution in water?

- (A) 0.095                      (B) 0.089                      (C) 0.9                      (D) 1.2

**Ans.** (B)

**Sol.** 100 gm of solution contain 20 gm  $C_2H_5OH$  and 80 gm of water

$$\therefore \text{moles of ethanol present} = \frac{20}{46} = 0.435$$

(mol. wt of ethanol = 46)

$$\therefore \text{moles of water present} = \frac{80}{18} = 4.444$$

$$\text{Total no. of moles} = 0.435 + 4.444 = 4.879$$

$\therefore$  mole fraction of  $C_2H_5OH$

$$= \frac{0.435}{4.879} = 0.089$$

**Do yourself-2:**

- What volume of water is required to make 0.2 M solution from 16 mL of a 0.5 M solution?  
(A) 24 mL                      (B) 40 mL                      (C) 6.4 mL                      (D) 20 mL
- What approximate volume of 0.40 M  $Ba(OH)_2$  solution must be added to 50.0 mL of 0.30 M NaOH solution to get a solution in which the molarity of the  $OH^-$  ions is 0.50 M ?  
(A) 33 mL                      (B) 66 mL                      (C) 133 mL                      (D) 100 mL
- 100 mL 30% (w/v) NaOH solution is mixed with 100 ml 90% (w/v) NaOH solution. The molarity of final solution is-  
(A) 30M                      (B) 15M                      (C) 7.5M                      (D) 2M
- Molality (m) of a sulphuric acid solution in which the mol fraction of water is 0.85 is :  
(A) 4.9                      (B) 9.8                      (C) 19.6                      (D) Can't be determined
- The molality of a sulphuric acid solution is 0.2. Total weight of the solution having 100 g of solvent is about :  
(A) 119.6 g                      (B) 109.8 g                      (C) 104.9 g                      (D) 102 g
- For a mixture of 100 mL of 0.3 M  $CaCl_2$  solution and 400 mL of 0.1 M HCl solution, select the correct option:  
(A) Total concentration of cations = 0.14 M    (B)  $[Cl^-] = 0.2$  M  
(C) Both (A) and (B)                      (D) None of these
- What volume of water should be added to 50 ml of  $HNO_3$  having density  $1.5 \text{ g ml}^{-1}$  and 63.0% by weight to have one molar solution.

### 3. SOME SPECIAL CONCENTRATION TERMS

#### 3.1 VOLUME STRENGTH OF H<sub>2</sub>O<sub>2</sub>:

Strength of H<sub>2</sub>O<sub>2</sub> is represented as 10V, 20 V, 30 V etc.

**20V H<sub>2</sub>O<sub>2</sub>** means **one litre** of this sample of H<sub>2</sub>O<sub>2</sub> on decomposition gives **20L of O<sub>2</sub>** gas at **STP**.

Decomposition of H<sub>2</sub>O<sub>2</sub> is given as :

$$1 \text{ mole} \quad \frac{1}{2} \times 22.7 \text{ L O}_2 \text{ at STP}$$

$$= 34\text{g} \quad = 11.35 \text{ L O}_2 \text{ at STP}$$

$$\text{Molarity of H}_2\text{O}_2 \text{ (M)} = \frac{\text{Volume strength of H}_2\text{O}_2}{11.35}$$

$$\text{Strength (in g/L)} = \text{Molarity} \times \text{Mol. Wt} = \text{Molarity} \times 34$$

**Ex.16** A fresh H<sub>2</sub>O<sub>2</sub> solution is labeled 11.35 V at STP. This solution has the same concentration as a solution which is :

- (A) 3.4% (w / w)      (B) 3.4% (v / v)      (C) 3.4% (w / v)      (D) None of these

**Ans.** (C)

**Sol.**  $\text{Molarity of H}_2\text{O}_2 = \frac{\text{vol. strength}}{11.2} = \frac{11.35}{11.35} = 1$

Now,  $\%(\text{w/v}) = \frac{\text{wt. of solute in g}}{\text{wt. of solution in mL}} \times 100$

$$= \text{Molarity} \times \text{Mol. wt. of solute} \times \frac{1}{10}$$

$$= 1 \times 34 \times \frac{1}{10} = 3.4\%$$

#### 3.2. PERCENTAGE LABELING OF OLEUM:

Oleum is SO<sub>3</sub> dissolved in 100% H<sub>2</sub>SO<sub>4</sub>. Sometimes, oleum is reported as more than 100% by weight, say y% (where y > 100). This means that (y – 100) grams of water, when added to 100 g of given oleum sample, will combine with all the free SO<sub>3</sub> in the oleum to give 100% sulphuric acid.

Hence, weight % of free SO<sub>3</sub> in oleum =  $80(y - 100)/18$

**Ex.17** What volume of water is required (in mL) to prepare 1 L of 1 M solution of H<sub>2</sub>SO<sub>4</sub> (density = 1.5g/mL) by using 109% oleum and water only (Take density of pure water = 1 g/mL).

**Ans.** 1410.09 mL

**Sol.** 1 mole H<sub>2</sub>SO<sub>4</sub> in 1L solution = 98 g H<sub>2</sub>SO<sub>4</sub> in 1500 g solution = 98 g H<sub>2</sub>SO<sub>4</sub> in 1402 g water. Also, in 109% oleum, 9 g H<sub>2</sub>O is required to form 109 g pure H<sub>2</sub>SO<sub>4</sub> & so, to prepare 98 g H<sub>2</sub>SO<sub>4</sub>, water needed is  $9/109 \times 98 = 8.09$  g.

**Total water needed = 1402 + 8.09 = 1410.09 g = 1410.09 mL**

**Ex.18** A 50 gm oleum sample contains  $\left(\frac{400}{49}\right)$  gm of combined  $\text{SO}_3$ . Find percent label of the oleum sample.

**Ans.** (118)

**Sol.** Combined  $\text{SO}_3 = \left(\frac{400}{49}\right)$  g is present in  $\text{H}_2\text{SO}_4$

$$\text{mole of } \text{SO}_3 = \frac{\frac{400}{49}}{80} = \frac{5}{49}$$

$$\text{mole of } \text{H}_2\text{SO}_4 \text{ in oleum} = \frac{5}{49}$$

$$\text{In 50 g oleum mass of } \text{H}_2\text{SO}_4 = \frac{5}{49} \times 98 = 10 \text{ g}$$

$$100 \text{ g oleum mass of } \text{H}_2\text{SO}_4 = 20 \text{ g}$$

$$\text{mass of } \text{SO}_3 = 100 - 20 = 80 \text{ g}$$

mass 80 g

$$\text{mol} = \frac{80}{80} = 1 \text{ mol} = 18 \text{ g}$$

$$\% \text{ labeling} = (100 + 18) \% = 118 \%$$

#### 4. EUDIOMETRY OR GAS MIXTURE ANALYSIS:

Gaseous reactions are carried out in a special type of tube known as eudiometer tube. The tube is graduated in millimeters for volume measurement. The reacting gases taken in the eudiometer tube are exploded by sparks. The volume of the products of a gases are determined by absorbing them in suitable reagents,

| Eg. | Solvent                            | gas(es) absorb                          |
|-----|------------------------------------|---|
|     | KOH                                | $\text{CO}_2, \text{SO}_2, \text{Cl}_2$ |
|     | Ammonical $\text{Cu}_2\text{Cl}_2$ | CO                                      |
|     | Turpentine oil                     | $\text{O}_3$                            |
|     | Alkaline pyrogallol                | $\text{O}_2$                            |
|     | Water                              | $\text{NH}_3, \text{HCl}$               |
|     | $\text{CuSO}_4$                    | $\text{H}_2\text{O}$                    |

Eudiometry is mainly based on Avogadro's law i.e.  $V \propto n$  at the same temperature and pressure.

$\therefore$  The mole concept may be applied in solving the problems, keeping in mind that in a gaseous reaction the relative volumes (measured under identical conditions) of each reactant and product represent their relative numbers of moles.

\* Generally, explosions are carried out at STP and  $\text{H}_2\text{O}$  is assumed to be in liquid state, means its volume is negligible as compared to product gases.

## Burning of hydrocarbon :

1. Hydrocarbon containing carbon and hydrogen only.

2. Hydrocarbon containing carbon and hydrogen and oxygen.

**Ex.19** A gaseous hydrocarbon requires 6 times its own volume of  $O_2$  for complete oxidation and produces 4 times its volume of  $CO_2$ . What is its formula?

**Ans.**  $C_4H_8$

**Sol.** The balanced equation for combustion

$$1 \text{ volume} \left(x + \frac{y}{4}\right) \text{ volume}$$

$$\therefore x + \frac{y}{4} = 6 \text{ (by equation)}$$

$$\text{or } 4x + y = 24 \quad \dots\dots(1)$$

Again  $x = 4$  since evolved  $CO_2$  is 4 times that of hydrocarbon

$$\therefore 16 + y = 24 \text{ or } y = 8 \therefore \text{ formula of hydrocarbon } C_4H_8$$

**Ex.20** 7.5 ml of a gaseous hydrocarbon was exploded with 36 ml of oxygen. The volume of gases on cooling was found to be 28.5 ml, 15 ml of which was absorbed by KOH and the rest was absorbed in a solution of alkaline pyrogallol. If all volumes are measured under same conditions, the formula of hydrocarbon is

- (A)  $C_3H_4$                       (B)  $C_2H_4$                       (C)  $C_2H_6$                       (D)  $C_3H_6$

**Ans.** (B)

$$7.5 \text{ ml } 36 \text{ ml}$$

$$36 - 7.5 \left(x + \frac{y}{4}\right) + 7.5x = 28.5$$

$$36 - 7.5 \left(15 + \frac{y}{4}\right) + 7.5x = 28.5$$

$$y = 4$$

$$x = 2$$

$$\text{So formula} = C_2H_4$$

**Ex.21** A 30 mL mixture of CO, CH<sub>4</sub> and He gases is exploded by an electric discharge at room temperature with excess of oxygen. The decrease in volume is found to be 13 mL. A further contraction of 14 mL occurs, when the residual gas is treated with KOH solution. Find out the composition of the gaseous mixture in terms of volume percentage.

**Ans.** Percentage composition of CO = 33.33 %; CH<sub>4</sub> = 13.33 % : He = 53.33 %

**Sol.** Let the volume of CO be 'a' mL and CH<sub>4</sub> be 'b' mL

∴ Volume of He = (30 – a – b)

on explosion with oxygen

'a' mL of CO give 'a' mL of CO<sub>2</sub> and 'b' mL of CH<sub>4</sub> gives 'b' mL of CO<sub>2</sub>.

Therefore the volume decrease is due to the consumption of O<sub>2</sub>. O<sub>2</sub> consumed for 'a' mL of

CO is  $\frac{a}{2}$  mL and O<sub>2</sub> consumed for 'b' mL of CH<sub>4</sub> is '2b' mL

$$\therefore \frac{a}{2} + 2b = 13$$

The further contraction occurs because of the absorption of CO<sub>2</sub> by KOH, a + b = 14

$$\therefore b = 4 \text{ mL}$$

$$\therefore a = 10 \text{ mL}$$

$$\therefore \text{Percentage composition of CO} = \frac{10}{30} \times 100 = 33.33 \%$$

$$\text{Percentage composition of CH}_4 = \frac{4}{30} \times 100 = 13.33$$

$$\text{Percentage composition of He} = \frac{(30 - 10 - 4)}{30} \times 100 = 53.33 \%$$

### Do yourself-3:

- A gaseous alkane is exploded with oxygen. The volume of O<sub>2</sub> for complete combustion to CO<sub>2</sub> formed is in the ratio 7/4. The molecular formula of alkane is :  
(A) C<sub>2</sub>H<sub>4</sub>                      (B) C<sub>2</sub>H<sub>6</sub>                      (C) CH<sub>4</sub>                      (D) C<sub>4</sub>H<sub>12</sub>
- 10 ml of gaseous hydrocarbon is exploded with 100 ml O<sub>2</sub>. The residual gas on cooling is found to measure 95 ml of which 20 ml is absorbed by KOH and the remainder by alkaline pyrogallol. The formula of the hydrocarbon is :  
(A) CH<sub>4</sub>                      (B) C<sub>2</sub>H<sub>6</sub>                      (C) C<sub>2</sub>H<sub>4</sub>                      (D) C<sub>2</sub>H<sub>2</sub>

## ANSWER KEY

### DO YOURSELF

#### Do yourself-1:

1. (D)

**Sol.** (a)  $M = \frac{4.9}{98} \times \frac{1000}{500} = 0.1 \text{ M}$

(b)  $M = \frac{2 \text{ mole}}{500} \times 1000 = 4 \text{ M.}$

2. (B)

**Sol.**  $\text{Volume} = \frac{\text{No. of moles}}{\text{Molarity}} = \frac{0.365 / 36.5}{0.1} = 0.1$

3. (B)

**Sol.**  $M = \frac{n_{\text{solute}}}{V_{\text{solution}}}$

$$\frac{0.8}{1000} = \frac{100 \times 10^{-3}}{\text{vol. of solution}}$$

vol. of solution = 125 ml

(Here  $n_{\text{solute}}$  = mole of solute,  $V_{\text{solution}}$  = vol. of solution).

4. (D)

**Sol.** Only Molarity depend on temperature molality, mole -fraction & % w/w do not depend on temperature.

5. 20%

**Sol.** Volume of alcohol = 20 cm<sup>3</sup>

Volume of water = 80 cm<sup>3</sup>

Percentage of alcohol =  $\frac{20}{20 + 80} \times 100 = 20\%$

6. (B)

**Do yourself-2:**

1. (A)

**Sol.**  $M_1V_1 = M_2V_2$   
 $0.5 \times 16 = 0.2 \times V_2$   
 $V_2 = 40 \text{ ml}$   
 Volume of water =  $40 - 16 = 24 \text{ mL}$

2. (A)

**Sol.** Molarity of  $\text{OH}^- = \frac{\text{Total moles of } \text{OH}^-}{\text{Total Vol. of solution}}$   
 $0.50 = \frac{(2 \times 0.40 \times V_{\text{ml}}) + 0.30 \times 50}{V_{\text{ml}} + 50}$   
 So  $V = 33 \text{ ml}$ .

3. (B)

**Sol.** Total NaOH in 100 ml (1st solution) = 30 gm  
 Total NaOH in 100 ml (2nd solution) = 90 gm  
 $\therefore \text{Molarity} = \left( \frac{120/40}{200/1000} \right) = 15\text{M}$

4. (B)

**Sol.**  $X_{\text{H}_2\text{O}} = 0.85$        $X_{\text{H}_2\text{SO}_4} = 0.15$   
 $m = \frac{0.15}{0.85 \times 18} \times 1000 = 9.8$

5. (D)

6. (C)

**Sol.** Molarity of cation =  $\frac{M_1V_1 + M_2V_2}{V_1 + V_2} = \frac{0.6}{5} = 0.12 \text{ M}$   
 Molarity of  $\text{Cl}^- = \frac{3(0.2)100 + 0.1 \times 400}{500} = 0.2 \text{ M}$ .

7. 700 ml.

**Sol.** Volume of  $\text{HNO}_3 = 50 \text{ ml}$ , density = 1.5  
 $d = \frac{M}{V}$ , mass of solution =  $50 \times 1.5$   
 weight of  $\text{HNO}_3 = \frac{75 \times 63}{100} = \frac{3}{4} \times 63$   
 Mole of  $\text{HNO}_3 = \frac{3}{4} \times \frac{63}{63} = \frac{3}{4} \text{ Mole}$   
 $M = \frac{\text{Mole of } \text{HNO}_3}{\text{Volume of solution}} = 1 = \frac{3}{4 \times V_{\text{lit}}} = 1$   
 $V = \frac{3}{4} \text{ L} = 750 \text{ ml}$

**Do yourself-3:**

1. (B)

$$\frac{x + \frac{y}{4}}{x} = \frac{7}{4}$$

$$\frac{y}{4x} = \frac{3}{4} \quad \frac{y}{x} = \frac{3}{1}$$

2. (D)

**Sol.** Volume of  $CO_2 = 20$  ml (absorbed gas by KOH)

Volume of air unreacted =  $95 - 20 = 75$  (gas absorbed by pyrogallol)

$O_2$  reacted =  $100 - 75 = 25$  ml

10 ml hydrocarbon liberates 20 ml  $CO_2$ .

2 atoms of 'C' are present in the compound.

initial    10 ml    25 ml

final      0      0          20      10 ml

volume of water vapours =  $(25 - 20) \times 2 = 10$  ml

10 ml hydrocarbon gives 10 ml water vapours.

No. of Hydrogen atoms in compounds are 2.

Compound will be  $C_2H_2$ .

**EXERCISE # (S-I)****DEFINATIONS OF CONCENTRATION TERMS**

1. Calculate the molarity of the following solutions:  
(a) 4g of caustic soda is dissolved in 200 mL of the solution.  
(b) 5.3 g of anhydrous sodium carbonate is dissolved in 100 mL of solution.  
(c) 0.365 g of pure HCl gas is dissolved in 50 mL of solution.
2. 0.115 gm of sodium metal was dissolved in 500 ml of the solution in distilled water. Calculate the molarity of the solution?
3. The average concentration of  $\text{Na}^+$  ion in human body is 3 to 4 gm per litre. The molarity of  $\text{Na}^+$  ion is about.
4. What is the concentration of chloride ion, in molarity, in a solution containing 10.56 gm  $\text{BaCl}_2 \cdot 8\text{H}_2\text{O}$  per litre of solution? ( $\text{Ba} = 137$ )
5. How much  $\text{BaCl}_2$  (in gm) would be needed to make 250 ml of a solution having the same concentration of  $\text{Cl}^-$  as one containing 1.825 gm HCl per 100 ml ? ( $\text{Ba} = 137$ )
6. Equal moles of  $\text{H}_2\text{O}$  and  $\text{NaCl}$  are present in a solution. Find molality of solution?
7. What is the quantity of water (in g) that should be added to 16 g. methanol to make the mole fraction of methanol as 0.25:
8. If 0.5 M methanol undergo self dissociation like  $\text{CH}_3\text{OH} \rightleftharpoons \text{CH}_3\text{O}^- + \text{H}^+$  & if concentration of  $\text{H}^+$  is  $2.5 \times 10^{-4}$  M then calculate % dissociation of methanol.

**INTERCONVERSION OF CONCENTRATION TERMS**

9. Density of a solution containing 13% by mass of sulphuric acid is 0.98 g/mL. Then molarity of solution will be
10. The density of a solution containing 40% by mass of HCl is 1.2 g/mL. Calculate the molarity of the solution.
11. 15 g of methyl alcohol is present in 100 mL of solution. If density of solution is  $0.90 \text{ g mL}^{-1}$ . Calculate the mass percentage of methyl alcohol in solution

12. A 6.90 M solution of KOH in water contains 30% by mass of KOH. What is density of solution in gm/ml.
13. The concentration of a solution of NaOH is 8% (w/w) and 10% (w/v). Calculate density (in gm/ml) of solution?
14. The mole fraction of solute in aqueous urea solution is 0.2. Calculate the mass percent of solute?
15. Calculate molality (m) of each ion present in the aqueous solution of 2M  $\text{NH}_4\text{Cl}$  assuming 100% dissociation according to reaction.  

$$\text{NH}_4\text{Cl (aq)} \longrightarrow \text{NH}_4^+ \text{ (aq)} + \text{Cl}^- \text{ (aq)}$$

Given : Density of solution = 3.107 gm / ml.
16. The concentration of  $\text{Ca}(\text{HCO}_3)_2$  in a sample of hard water is 405 ppm. The density of water sample is 1.0 gm/ml. Calculate the molarity of solution ?
17. Units of parts per million (ppm) or per billion (ppb) are often used to describe the concentrations of solutes in very dilute solutions. The units are defined as the number of grams of solute per million or per billion grams of solvent. Bay of Bengal has 1.9 ppm of lithium ions. What is the molality of  $\text{Li}^+$  in this water ?

#### PROBLEMS RELATED WITH MIXING & DILUTION

18. Find molarity of  $\text{Na}^+$  ions if 500 mL of 0.2 M  $\text{NaCl}_{(\text{aq})}$  solution is mixed with 500 mL 0.5 M  $\text{Na}_2\text{SO}_4_{(\text{aq})}$  solution ?
19. Find out the volume of 98% w/w  $\text{H}_2\text{SO}_4$  (density = 1.8 gm/ ml), must be diluted to prepare 12.5 litres of 2.5 M sulphuric acid solution
20. Determine the volume (in mL) of diluted nitric acid 20% w/v  $\text{HNO}_3$  that can be prepared by diluting 50 mL of conc.  $\text{HNO}_3$  with water 69.8% w /v.
21. 500 gm of urea solution of mole fraction 0.2 is diluted to 1500 gm. Calculate the mole fraction of solute in the diluted solution ?
22. When V ml of 2.2 M  $\text{H}_2\text{SO}_4$  solution is mixed with 10 V ml of water, the volume contraction of 2% take place. Calculate the molarity of diluted solution ?
23. 500 ml of 2 M NaCl solution was mixed with 200 ml of 2 M NaCl solution. Calculate the final volume and molarity of NaCl in final solution if final solution has density 1.5 gm/ml.

24. Calculate the amount of the water "in ml" which must be added to a given solution of concentration of 40 mg silver nitrate per ml, to yield a solution of concentration of 16 mg silver nitrate per ml ?
25. What volume (in ml) of 0.8 M  $\text{AlCl}_3$  solution should be mixed with 50 ml of 0.2M  $\text{CaCl}_2$  solution to get solution of chloride ion concentration equal to 0.6 M ?
26. A mixture containing equimolar amounts of  $\text{Ca(OH)}_2$  and  $\text{Al(OH)}_3$  requires 0.5 L of 4.0 M HCl to react with it completely. Total moles of the mixture are :
27. How would you prepare exactly 3.0 litre of 1.0 M NaOH by mixing proportions of stock solution of 2.50 M NaOH and 0.40 M NaOH. No water is to be used. Find the ratio of the volume ( $v_1/v_2$ ).
28. 20 mL of 0.2M  $\text{Al}_2(\text{SO}_4)_3$  is mixed with 30 mL of 0.6 M  $\text{BaCl}_2$ . Calculate the mass of  $\text{BaSO}_4$  formed in solution.

### SOME TYPICAL CONCENTRATION TERMS

29. 50 ml of '20V'  $\text{H}_2\text{O}_2$  is mixed with 200 ml, '10V'  $\text{H}_2\text{O}_2$ . Find the volume strength of resulting solution?
30. 500 ml of a  $\text{H}_2\text{O}_2$  solution on complete decomposition produces 2 moles of  $\text{H}_2\text{O}$ . Calculate the volume strength of  $\text{H}_2\text{O}_2$  solution? **[Given: Volume of  $\text{O}_2$  is measured at 1atm and 273 K]**
31. An oleum sample is labeled as 118 %, Calculate
  - (i) Mass of  $\text{H}_2\text{SO}_4$  in 100 gm oleum sample.
  - (ii) Maximum mass of  $\text{H}_2\text{SO}_4$  that can be obtained if 30 gm sample is taken.
  - (iii) Composition of mixture (mass of components) if 40 gm water is added to 30 gm given oleum sample.
32. A mixture is prepared by mixing 10 gm  $\text{H}_2\text{SO}_4$  and 40 gm  $\text{SO}_3$  calculate,
  - (a) mole fraction of  $\text{H}_2\text{SO}_4$
  - (b) % labeling of oleum

### ANALYSIS OF GAS MIXTURE

33. When 100 ml of a  $O_2 - O_3$  mixture was passed through turpentine, there was reduction of volume by 20 ml. If 100 ml of such a mixture is heated, what will be the increase in volume?
34. 60 ml of a mixture of nitrous oxide and nitric oxide was exploded with excess of hydrogen. If 38 ml of  $N_2$  was formed, calculate the volume of NO gas in the mixture.
35. 20 ml of a mixture of  $C_2H_2$  and CO was exploded with 30 ml of oxygen. The gases after the reaction had a volume of 34 ml. On treatment with KOH, 8 ml of oxygen remained. Calculate the volume of  $C_2H_2$  in the mixture.
36. 10 ml of CO is mixed with 25 ml air having 20%  $O_2$  by volume. What would be the final volume if none of CO and  $O_2$  is left after the reaction?
37. Calculate the volume of  $CO_2$  evolved by the combustion of 50 ml of a mixture containing 40%  $C_2H_4$  and 60%  $CH_4$  (by volume)
38. 10 ml of a mixture of  $CH_4$ ,  $C_2H_4$  and  $CO_2$  were exploded with excess of air. After explosion and further cooling, there was contraction of 17 ml and after treatment with KOH, there was further reduction of 14 ml. What is the composition of the mixture?
39. Find the hydrocarbon for which volume of oxygen required is 1.5 times volume of carbon dioxide produced.
40. 10 moles of a mixture of CO (g) and  $CH_4$ (g) was mixed with 22 moles of  $O_2$  gas and subjected to sparking. Find the moles of gas absorbed when the residual gases are passed through alc. KOH.

## EXERCISE # (S-II)

1. What volume of 0.2 M NaOH (in ml) solution should be mixed to 500 ml of 0.5 M NaOH solution so that 300 ml of final solution is completely neutralised by 20 ml of 2 M  $\text{H}_3\text{PO}_4$  solution.  
[Assuming 100% dissociation]
2. How much minimum volume (in ml) of 0.1 M aluminium sulphate solution should be added to excess calcium nitrate to obtain atleast 1 gm of each salt in the reaction.  

$$\text{Al}_2(\text{SO}_4)_3 + 3\text{Ca}(\text{NO}_3)_2 \longrightarrow 2\text{Al}(\text{NO}_3)_3 + 3\text{CaSO}_4$$
3. One litre of milk weighs 1.035 kg. The butter fat is 10% (v/v) of milk has density of  $875 \text{ kg/m}^3$ . The density (in  $\text{gm/ml}$ ) of fat free skimmed milk is ?
4. 100 ml of 0.1 M solution of AB (  $d = 1.5 \text{ gm/ml}$  ) is mixed with 100 ml of 0.2 M solution of  $\text{CB}_2$  (  $d = 2.5 \text{ gm/ml}$  ). Calculate the molarity of  $\text{B}^-$  in final solution if the density of final solution is  $4 \text{ gm/ml}$ . Assuming AB and  $\text{CB}_2$  are non reacting & dissociates completely into  $\text{A}^+$ ,  $\text{B}^-$ ,  $\text{C}^{+2}$ .
5. 60 ml of a "x" % w/w alcohol by weight (  $d = 0.6 \text{ g/cm}^3$  ) must be used to prepare  $200 \text{ cm}^3$  of 12% alcohol by weight (  $d = 0.90 \text{ g/cm}^3$  ). Calculate the value of "x"?
6. 1120 gm of 2 'm' urea solution is mixed with 2480 gm of 4 'm' urea solution. Calculate the molality of the resulting solution?
7. To 100 ml of 5 M NaOH solution (density  $1.2 \text{ g/ml}$ ) were added 200 ml of another NaOH solution which has a density of  $1.5 \text{ g/ml}$  and contains 20 mass percent of NaOH. What will be the volume of the gas (at STP) in litres liberated when aluminium reacts with this (final) solution.  
The reaction is  $\text{Al} + \text{NaOH} + \text{H}_2\text{O} \longrightarrow \text{NaAlO}_2 + \text{H}_2$
8. 500 ml of 2M  $\text{CH}_3\text{COOH}$  solution is mixed with 600 ml 12% w/v  $\text{CH}_3\text{COOH}$  solution then calculate the final molarity of solution.
9. 120 gm of solution containing 40% by mass of NaCl are mixed with 200 gm of a solution containing 15% by mass NaCl.  
 (a) Determine the mass percent of sodium chloride in the final solution.  
 (b ) What is the molality of the above solution.  
 (c) What is the mole fraction of the solute.  
 (d) What is the molarity of solution if density of solution in  $1.6 \text{ gm/ml}$ .  
 (e) %c w/v of NaCl present in the solution.

## EXERCISE # (O-I)

### DEFINATIONS OF CONCENTRATION TERMS

- 8 g NaOH is dissolved in one litre of solution, its molarity is :  
(A) 0.8 M (B) 0.4 M (C) 0.2 M (D) 0.1 M
- The molarity of a solution of sodium chloride (mole wt. = 58.5) in water containing 5.85 gm of sodium chloride in 500 ml of solution is :  
(A) 0.25 (B) 2.0 (C) 1.0 (D) 0.2
- For preparing 0.1 M solution of  $\text{H}_2\text{SO}_4$  in one litre, we need  $\text{H}_2\text{SO}_4$  :  
(A) 0.98 g (B) 4.9 g (C) 49.0 g (D) 9.8 g
- $\text{H}_2\text{O}_2$  solution used for hair bleaching is sold as a solution of approximately 5.0 g  $\text{H}_2\text{O}_2$  per 100 mL of the solution. The molecular mass of  $\text{H}_2\text{O}_2$  is 34. The molarity of this solution is approximately:-  
(A) 0.15 M (B) 1.5 M (C) 3.0 M (D) 3.4 M
- 171 g of cane sugar ( $\text{C}_{12}\text{H}_{22}\text{O}_{11}$ ) is dissolved in 1 litre of water. The molarity of the solution is :  
(A) 2.0 M (B) 1.0 M (C) 0.5 M (D) 0.25 M
- How much grams of  $\text{CH}_3\text{OH}$  should be dissolved in water for preparing 150 ml. of 2.0 M  $\text{CH}_3\text{OH}$  solution  
(A) 9.6 (B) 2.4 (C)  $9.6 \times 10^3$  (D)  $4.3 \times 10^2$
- Equal weight of NaCl and KCl are dissolved separately in equal volumes of solutions molarity of the two solutions will be –  
(A) Equal  
(B) That of NaCl will be less than that of KCl  
(C) That of NaCl will be more than that of KCl Solution  
(D) That of NaCl will be half of that of KCl solution
- The molarity of pure water is :  
(A) 100 M (B) 55.5 M (C) 50 M (D) 18M
- Molarity of liquid HCl if density of solution is 1.17 g/cc. :  
(A) 36.5 (B) 18.25 (C) 32.05 (D) 42.10
- If 18 g of glucose is present in 1000 g of solvent, the solution is said to be :  
(A) 1 molar (B) 0.1 molar (C) 0.5 molar (D) 0.1 molal
- A molal solution is one that contains one mole of a solute in  
(A) 1000 g of the solvent (B) one litre of the solution  
(C) one litre of the solvent (D) 22.4 litres of the solution

12. Which of the following solution has maximum mass of pure NaOH ?  
 (I) 50 g of 40% (W/W) NaOH  
 (II) 50 mL of 40% (W/V) NaOH ( $d_{\text{sol}} = 1.2 \text{ g/ml}$ ).  
 (III) 50 g of 12 M NaOH ( $d_{\text{sol}} = 1 \text{ g/ml}$ ).  
 (A) I (B) II (C) III (D) III = II = I.
13. Mole fraction of  $\text{C}_3\text{H}_5(\text{OH})_3$  (glycerine) in a solution of 36 g of water and 46 g of glycerine is :  
 (A) 0.46 (B) 0.36 (C) 0.20 (D) 0.40
14. The mole fraction of oxygen in a mixture of 7g of nitrogen and 8g of oxygen is :  
 (A)  $\frac{8}{15}$  (B) 0.5 (C) 0.25 (D) 1.0
15. 1000 g aqueous solution of  $\text{CaCO}_3$  contains 10 g of calcium carbonate concentration of the solution is :  
 (A) 10 ppm (B) 100 ppm (C) 1000 ppm (D) 10,000 ppm
16. Which one of the following modes of expressing concentration of solution is independent of temperature—  
 (A) Molarity (B) Molality (C) % w/v (D) Grams per litre
17. One mole mixture of  $\text{CH}_4$  & air (containing 80%  $\text{N}_2$  20%  $\text{O}_2$  by volume) of a composition such that when underwent combustion gave maximum heat (assume combustion of only  $\text{CH}_4$ ). Then which of the statements are correct, regarding composition of initial mixture.(X presents mole fraction)  
 (A)  $x_{\text{CH}_4} = \frac{1}{11}$ ,  $x_{\text{O}_2} = \frac{2}{11}$ ,  $x_{\text{N}_2} = \frac{8}{11}$  (B)  $x_{\text{CH}_4} = \frac{3}{8}$ ,  $x_{\text{O}_2} = \frac{1}{8}$ ,  $x_{\text{N}_2} = \frac{1}{2}$   
 (C)  $x_{\text{CH}_4} = \frac{1}{6}$ ,  $x_{\text{O}_2} = \frac{1}{6}$ ,  $x_{\text{N}_2} = \frac{2}{3}$  (D) Data insufficient

### INTERCONVERSION OF CONCENTRATION TERMS

18. The molarity of 98% by wt.  $\text{H}_2\text{SO}_4$  ( $d = 1.8 \text{ g/ml}$ ) is  
 (A) 6 M (B) 18 M (C) 10 M (D) 4 M
19. Mole fraction of A in  $\text{H}_2\text{O}$  is 0.2. The molality of A in  $\text{H}_2\text{O}$  is :  
 (A) 13.9 (B) 15.5 (C) 14.5 (D) 16.8
20. The molarity of the solution containing 2.8% (mass / volume) solution of KOH is :  
 (Given atomic mass of K = 39) is :  
 (A) 0.1 M (B) 0.5 M (C) 0.2 M (D) 1 M
21. Calculate the mass percent (w/w) of sulphuric acid in a solution prepared by dissolving 4 g of sulphur trioxide in a 100 ml sulphuric acid solution containing 80 mass percent (w/w) of  $\text{H}_2\text{SO}_4$  and having a density of 1.96 g/ml. (molecular weight of  $\text{H}_2\text{SO}_4 = 98$ ). Take reaction  $\text{SO}_3 + \text{H}_2\text{O} \rightarrow \text{H}_2\text{SO}_4$   
 (A) 80.8% (B) 84% (C) 41.65% (D) 20%

**PROBLEMS RELATED WITH MIXING & DILUTION**

22. How much volume of 3.0 M  $\text{H}_2\text{SO}_4$  is required for the preparation of 1.0 litre of 1.0 M solution?  
(A) 300 ml                      (B) 320 ml                      (C) 333.3 ml                      (D) 350.0 ml
23. How much water should be added to 200 cc of semi molar solution of NaOH to make it exactly deci molar:  
(A) 1000 cc                      (B) 400 cc                      (C) 800 cc                      (D) 600 cc
24. The molarity of a solution made by mixing 50 ml of conc.  $\text{H}_2\text{SO}_4$  (18 M) with 50 ml. of water, is:  
(A) 36 M                      (B) 18 M                      (C) 9 M                      (D) 6M
25. 100 ml of 0.3 M HCl solution is mixed with 200 ml of 0.3 M  $\text{H}_2\text{SO}_4$  solution what is the molarity of  $\text{H}^+$  in resultant solution.  
(A) 0.9                      (B) 0.6                      (C) 0.4                      (D) 0.5
26. 60 g of solution containing 40% by mass of NaCl are mixed with 100 g of a solution containing 15% by mass NaCl. Determine the mass percent of sodium chloride in the final solution.  
(A) 24.4%                      (B) 78%                      (C) 48.8%                      (D) 19.68%
27. 125 ml of 8% w/w NaOH solution (sp. gravity 1) is added to 125 ml of 10% w/v HCl solution. The nature of resultant solution would be \_\_\_\_\_.  
(A) basic                      (B) neutral                      (C) acidic                      (D) can't be predicted.
28. Equal volumes of 10% (v/v) of HCl is mixed with 10% (v/v) NaOH solution. If density of pure NaOH is 1.5 times that of pure HCl then the resultant solution be.  
(A) basic                      (B) neutral                      (C) acidic                      (D) can't be predicted.
29. What volumes should you mix of 0.2 M NaCl and 0.1 M  $\text{CaCl}_2$  solution so that in resulting solution the concentration of positive ion is 40% lesser than concentration of negative ion. Assuming total volume of solution 1000 ml.  
(A) 400 ml NaCl , 600 ml  $\text{CaCl}_2$                       (B) 600 ml NaCl, 400 ml  $\text{CaCl}_2$   
(C) 800 ml NaCl, 200 ml  $\text{CaCl}_2$                       (D) None of these
30. Assuming complete precipitation of AgCl, calculate the sum of the molar concentration of all the ions if 2 lit of 2M  $\text{Ag}_2\text{SO}_4$  is mixed with 4 lit of 1 M NaCl solution is :  
(A) 4M                      (B) 2M                      (C) 3 M                      (D) 2.5 M

### SOME TYPICAL CONCENTRATION TERMS

31. A fresh  $\text{H}_2\text{O}_2$  solution is labeled as 11.35 V. Calculate its concentration in % w/v ?  
 (A) 2.5% (B) 3.4% (C) 4.2% (D) 5.4%
32. 100 ml each of 2M  $\text{H}_2\text{O}_2$  and 11.35 V  $\text{H}_2\text{O}_2$  solution are mixed then find the strength of final solution in g/L.  
 (A) 25 (B) 51 (C) 42 (D) 54
33. 12.5gm of fuming  $\text{H}_2\text{SO}_4$  (labelled as 112%) is mixed with 100 lit water. Molar concentration of  $\text{H}^+$  in resultant solution is :  
 [Note : Assume that  $\text{H}_2\text{SO}_4$  dissociate completely and there is no change in volume on mixing]  
 (A)  $\frac{2}{700}$  (B)  $\frac{2}{350}$  (C)  $\frac{3}{350}$  (D)  $\frac{3}{700}$
34. Similar to the % labelling of oleum, a mixture of  $\text{H}_3\text{PO}_4$  and  $\text{P}_4\text{O}_{10}$  is labelled as  $(100 + x) \%$  where x is the maximum mass of water which can react with  $\text{P}_4\text{O}_{10}$  present in 100 gm mixture of  $\text{H}_3\text{PO}_4$  and  $\text{P}_4\text{O}_{10}$ . If such a mixture is labelled as 127 %. Mass of  $\text{P}_4\text{O}_{10}$  in 100 gm of mixture, is  
 (A) 71 gm (B) 47 gm (C) 83 gm (D) 35 gm
35. If 50 gm oleum sample rated as 118% is mixed with 18 gm water, then the correct option is  
 (A) The resulting solution contains 18 gm of water and 118 gm  $\text{H}_2\text{SO}_4$   
 (B) The resulting solution contains 9 gm water and 59 gm  $\text{H}_2\text{SO}_4$   
 (C) The resulting solution contains only 118 gm pure  $\text{H}_2\text{SO}_4$   
 (D) The resulting solution contains 68 gm of pure  $\text{H}_2\text{SO}_4$

### ANALYSIS OF GAS MIXTURE

36.  $\text{C}_6\text{H}_5\text{OH} (\text{g}) + \text{O}_2 (\text{g}) \longrightarrow \text{CO}_2 (\text{g}) + \text{H}_2\text{O} (\text{l})$   
 Magnitude of volume change if 30 ml of  $\text{C}_6\text{H}_5\text{OH} (\text{g})$  is burnt with excess amount of oxygen, is  
 (A) 30 ml (B) 60 ml (C) 20 ml (D) 10 ml
37. 10 ml of a compound containing 'N' and 'O' is mixed with 30 ml of  $\text{H}_2$  to produce  $\text{H}_2\text{O} (\text{l})$  and 10 ml of  $\text{N}_2 (\text{g})$ . Molecular formula of compound if both reactants reacts completely, is  
 (A)  $\text{N}_2\text{O}$  (B)  $\text{NO}_2$  (C)  $\text{N}_2\text{O}_3$  (D)  $\text{N}_2\text{O}_5$
38. When 20 ml of mixture of  $\text{O}_2$  and  $\text{O}_3$  is heated, the volume becomes 29 ml and disappears in alkaline pyragallol solution. What is the volume percent of  $\text{O}_2$  in the original mixture?  
 (A) 90% (B) 10% (C) 18% (D) 2%
39. The % by volume of  $\text{C}_4\text{H}_{10}$  in a gaseous mixture of  $\text{C}_4\text{H}_{10}$ ,  $\text{CH}_4$  and  $\text{CO}$  is 40. When 200 ml of the mixture is burnt in excess of  $\text{O}_2$ . Find volume (in ml) of  $\text{CO}_2$  produced.  
 (A) 220 (B) 340 (C) 440 (D) 560

40. The percentage by volume of  $C_3H_8$  in a mixture of  $C_3H_8$ ,  $CH_4$  and  $CO$  is 36.5. Calculate the volume of  $CO_2$  produced when 100 mL of the mixture is burnt in excess of  $O_2$ .  
(A) 173 mL (B) 106.5 mL (C) 206.5 mL (D) 156.5 mL
41. 4 gm of  $C_3H_8$  and 14 gm of  $O_2$  are allowed to react maximum possible extent to forms only  $CO$  &  $H_2O$ . In final gaseous mixture which of the given relation is incorrect-  
(A)  $\frac{n_{CO}}{n_{O_2}} = \frac{16}{7}$  (B)  $\%w_{CO} = \frac{200}{3}$  (C)  $W_{CO} = 7.636$  gm (D)  $W_{CO} = 14$  gm
42. One litre of  $CO_2$  passed over hot coke the volume becomes 1.4 litres then the composition of products will not be (At STP)  
(A)  $v_{CO_2} : V_{CO} = 3 : 4$  (B)  $v_{CO_2} = 1.6$  ltr. (C)  $n_{CO_2} : n_{CO} = 3 : 4$  (D)  $\% V \text{ of } CO = \frac{400}{7}$
43. 25 moles of mixture of  $SO_2$  &  $O_2$  was passed over a catalyst 8 moles of  $SO_3$  was formed. After reaction the final mixture composition is/are -  
(A) 17 mole of  $O_2$ , 8 mole of  $SO_3$  (B) 13 mole of  $SO_2$ , 8 mole of  $O_2$   
(C) 9 mole of  $O_2$ , 12 mole of  $SO_3$  (D) 15 mole of  $O_2$ , 10 mole of  $SO_3$
44. A definite amount of gaseous hydrocarbon was burnt with just sufficient amount of  $O_2$ . The volume of all reactants was 600 ml, after the explosion the volume of the products [ $CO_2(g)$  and  $H_2O(g)$ ] was found to be 700 ml under the similar conditions. The molecular formula of the compound is  
(A)  $C_3H_8$  (B)  $C_3H_6$  (C)  $C_3H_4$  (D)  $C_4H_{10}$
45. For a chemical reaction occurring at constant pressure and temperature.  
 $2A(g) + 5B(g) \longrightarrow C(g) + 2D(g)$   
(A) Contraction in volume is double the volume of A taken if B is taken in excess.  
(B) Contraction in volume is more than the volume of B taken if A is in excess.  
(C) Volume contracts by 20 mL if 10 mL A is reacted with 20 mL B.

## EXERCISE # (O-II)

- Statement-1** : Molality of pure ethanol is lesser than pure water.  
**Statement-2** : As density of ethanol is lesser than density of water.  
**[Given :  $d_{\text{ethanol}} = 0.789 \text{ gm/ml}$ ;  $d_{\text{water}} = 1 \text{ gm/ml}$ ]**

(A) Statement-1 is true, statement-2 is true and statement-2 is correct explanation for statement-1.  
 (B) Statement-1 is true, statement-2 is true and statement-2 is NOT the correct explanation for statement-1.  
 (C) Statement-1 is false, statement-2 is true.  
 (D) Statement-1 is true, statement-2 is false.
- Statement -1** : Mass of a solution of 1 litre of 2M  $\text{H}_2\text{SO}_4$  [ $d_{\text{solution}} = 1.5 \text{ gm/ml}$ ] is greater than the mass of solution containing 400 gm MgO which is labelled as 40% (w/w) MgO.  
**Statement -2** : Mass of  $\text{H}_2\text{SO}_4$  in 1 litre 2M  $\text{H}_2\text{SO}_4$  [ $d_{\text{solution}} = 1.5 \text{ gm/ml}$ ] is greater than the mass of MgO in 1 litre 40% (w/w) MgO [ $d_{\text{solution}} = 2 \text{ gm/ml}$ ] solution.

(A) Statement-1 is true, statement-2 is true and statement-2 is correct explanation for statement-1.  
 (B) Statement-1 is true, statement-2 is true and statement-2 is NOT the correct explanation for statement-1.  
 (C) Statement-1 is false, statement-2 is true.  
 (D) Statement-1 is true, statement-2 is false.

### ONE OR MORE THAN ONE MAY BE CORRECT

- Solution(s) containing 40 gm NaOH is/are

(A) 50 gm of 80% (w/w) NaOH  
 (B) 50 gm of 80% (w/v) NaOH [ $d_{\text{soln.}} = 1.2 \text{ gm/ml}$ ]  
 (C) 50 gm of 20 M NaOH [ $d_{\text{soln.}} = 1 \text{ gm/ml}$ ]  
 (D) 50 gm of 5m NaOH
- The incorrect statement(s) regarding 2M  $\text{MgCl}_2$  aqueous solution is/are ( $d_{\text{solution}} = 1.09 \text{ gm/ml}$ )

(A) Molality of  $\text{Cl}^-$  is 4.44 m  
 (B) Mole fraction of  $\text{MgCl}_2$  is exactly 0.035  
 (C) The conc. of  $\text{MgCl}_2$  is 19% w/v  
 (D) The conc. of  $\text{MgCl}_2$  is  $19 \times 10^4 \text{ ppm}$
- A sample of  $\text{H}_2\text{O}_2$  solution labelled as 56 volume has density of 530 gm/L. Mark the correct option(s) representing concentration of same solution in other units. (Solution contains only  $\text{H}_2\text{O}$  and  $\text{H}_2\text{O}_2$ )

(A)  $M_{\text{H}_2\text{O}_2} = 6$   
 (B)  $\% \frac{w}{v} = 17$   
 (C) Mole fraction of  $\text{H}_2\text{O}_2 = 0.25$   
 (D)  $m_{\text{H}_2\text{O}_2} = \frac{1000}{72}$

6. 100 mL of 0.06 M  $\text{Ca}(\text{NO}_3)_2$  is added to 50 mL of 0.06 M  $\text{Na}_2\text{C}_2\text{O}_4$ . After the reaction is complete ( $\text{CaC}_2\text{O}_4$  is precipitated)
- (A) 0.003 moles of calcium oxalate will get precipitated  
 (B) 0.003 M  $\text{Ca}^{2+}$  will remain in excess  
 (C)  $\text{Na}_2\text{C}_2\text{O}_4$  is the limiting reagent  
 (D) Oxalate ion ( $\text{C}_2\text{O}_4^{2-}$ ) concentration in final solution is 0.003 M

**MATCH THE COLUMN**

- 7.
- |     | <b>Column I</b>   |     | <b>Column II</b>   |
|-----|---|-----|--|
| (A) | 10 M $\text{MgO}$<br>( $d_{\text{solution}} = 1.20 \text{ gm/ml}$ )<br>Solute : $\text{MgO}$<br>Solvent: $\text{H}_2\text{O}$     | (P) | $W_{\text{solvent}} = 120 \text{ gm per 100 ml of solution}$ |
| (B) | 40% w/v $\text{NaOH}$<br>( $d_{\text{solution}} = 1.6 \text{ gm/ml}$ )<br>Solute : $\text{NaOH}$<br>Solvent: $\text{H}_2\text{O}$ | (Q) | $W_{\text{solution}} = 150 \text{ gm per 100 gm solvent}$    |
| (C) | 8 m $\text{CaCO}_3$<br>Solute : $\text{CaCO}_3$<br>Solvent: $\text{H}_2\text{O}$  | (R) | $W_{\text{solute}} = 120 \text{ gm per 100 gm of solvent}$   |
| (D) | 0.6 mol fraction of 'X'<br>(molecular mass = 20)<br>in 'Y' (molecular mass 25)<br>Solute : X<br>Solvent : Y                       | (S) | $W_{\text{solvent}} = 125 \text{ gm per 100 gm of solute}$   |

- 8.
- |     | <b>Column-I</b>  |     | <b>Column-II</b> |
|-----|--|-----|------------------|
| (A) | 120 g $\text{CH}_3\text{COOH}$ in 1 L solution<br>$d_{\text{sol}} = 1.2 \text{ g/mL}$                      | (P) | $M = 2$          |
| (B) | 120 g glucose dissolved in 1 L solution<br>( $d_{\text{sol}} = 1.2 \text{ g/mL}$ )                         | (Q) | 10% w/w solution |

### COMPREHENSION

#### Comprehension 12 and 13 (2 questions)

2 litre of 9.8 % w/w  $\text{H}_2\text{SO}_4$  ( $d = 1.5 \text{ gm/ml}$ ) solution is mixed with 3 litre of 1 M KOH solution.

12. The number of moles  $\text{H}_2\text{SO}_4$  added are  
(A) 1 (B) 2 (C) 3 (D) 0.5
13. The concentration of  $\text{H}^+$  if solution is acidic or concentration of  $\text{OH}^-$  if solution is basic in the final solution is  
(A) 0 (B)  $\frac{3}{10}$  (C)  $\frac{3}{5}$  (D)  $\frac{2}{5}$

#### Comprehension 14 and 15 (2 questions)

30 gm  $\text{H}_2\text{SO}_4$  is mixed with 20 gram  $\text{SO}_3$  to form mixture.

14. Find mole fraction of  $\text{SO}_3$  .  
(A) 0.2 (B) 0.45 (C) 0.6 (D) 0.8
15. Determine % labelling of oleum solution.  
(A) 104.5 (B) 106 (C) 109 (D) 110

#### Comprehension 16 and 17 (2 questions)

##### Estimation of halogens :

**Carius method :** A known mass of compound is heated with conc.  $\text{HNO}_3$  in the presence of  $\text{AgNO}_3$  contained in a hard glass tube known as carius tube in a furnace. C and H are oxidised to  $\text{CO}_2$  and  $\text{H}_2\text{O}$ . The halogen forms the corresponding  $\text{AgX}$ . It is filtered, dried, and weighed.

**Estimation of sulphur :** A known mass of compound is heated with fuming  $\text{HNO}_3$  or sodium peroxide ( $\text{Na}_2\text{O}_2$ ) in the presence of  $\text{BaCl}_2$  solution in Carius tube. Sulphur is oxidised to  $\text{H}_2\text{SO}_4$  and precipitated as  $\text{BaSO}_4$ . It is filtered, dried and weighed.

16. 0.15gm of an organic compound gave 0.12 gm of silver bromide by the Carius method. Find the percentage of bromine in the compound.  
(A) 34.0 (B) 40 (C) 17 (D) 68
17. 0.2595 gm of an organic substance when treated by Carius method gave 0.35gm of  $\text{BaSO}_4$ . Calculate the percentage of sulphur in the compound.  
(A) 9 (B) 30.4 (C) 18.52 (D) 40.52

#### Comprehension 18 and 19 (2 questions)

##### Estimation of phosphorous :

A known mass of compound is heated with fuming  $\text{HNO}_3$  or sodium peroxide ( $\text{Na}_2\text{O}_2$ ) in Carius tube which converts phosphorous to  $\text{H}_3\text{PO}_4$ . Magnesia mixture ( $\text{MgCl}_2 + \text{NH}_4\text{Cl}$ ) is then added, which gives the precipitate of magnesium ammonium phosphate ( $\text{MgNH}_4\text{PO}_4$ ) which on heating gives magnesium pyrophosphate ( $\text{Mg}_2\text{P}_2\text{O}_7$ ), which is weighed.

18. 0.12 gm of an organic compound containing phosphorus gave 0.22 gm of  $\text{Mg}_2\text{P}_2\text{O}_7$  by the usual analysis. Calculate the percentage of phosphorous in the compound.  
(A) 25 (B) 9.25 (C) 80.1 (D) 51.20
19. An organic compound has 6.2% of phosphorus. On sequence of reaction the phosphorous present in the 10gm of organic compound is converted to  $\text{Mg}_2\text{P}_2\text{O}_7$ . Find wt. of  $\text{Mg}_2\text{P}_2\text{O}_7$  formed.  
(A) 2.22 (B) 10.2 (C) 15 (D) 20

### Comprehension 20 and 23 (4 questions)

**Estimation of nitrogen** : There are two methods for the estimation of nitrogen (i) Dumas method and (ii) Kjeldahl's method.

**Dumas method** : A known mass of compound is heated with copper oxide ( $\text{CuO}$ ) in an atmosphere of  $\text{CO}_2$ , which gives free nitrogen along with  $\text{CO}_2$  and  $\text{H}_2\text{O}$ .

The gaseous mixture is passed over a heated copper gauze which converts traces of nitrogen oxides formed to  $\text{N}_2$ . The gaseous mixture is collected over an aqueous solution of  $\text{KOH}$  which absorbs  $\text{CO}_2$ , and nitrogen is collected in the upper part of the graduated tube.

**ii. Kjeldahl's method** : A known mass of organic compound (0.5 gm) is mixed with  $\text{K}_2\text{SO}_4$  (10 gm) and  $\text{CuSO}_4$  (1.0 gm) or a drop of mercury ( $\text{Hg}$ ) and conc.  $\text{H}_2\text{SO}_4$  (25 ml), and heated in Kjeldahl's flask.  $\text{CuSO}_4$  or  $\text{Hg}$  acts as a catalyst, while  $\text{K}_2\text{SO}_4$  raises the boiling point of  $\text{H}_2\text{SO}_4$ . The nitrogen in the organic compound is quantitatively converted to ammonium sulphate. The resulting mixture is then distilled with excess of  $\text{NaOH}$  solution and the  $\text{NH}_3$  evolved is passed into a known but excess volume of standard  $\text{HCl}$  or  $\text{H}_2\text{SO}_4$ . The acid left unused is estimated by titration with some standard alkali. The amount of acid used against  $\text{NH}_3$  can thus be known and from this the percentage of nitrogen is calculated.

- (a)  $\text{C} + \text{H} + \text{S} \xrightarrow[\text{H}_2\text{SO}_4]{\text{conc.}} \text{CO}_2 + \text{H}_2\text{O} + \text{SO}_2$
- (b)  $\text{N} \xrightarrow[\text{H}_2\text{SO}_4]{\text{conc.}} (\text{NH}_4)_2\text{SO}_4$
- (c)  $(\text{NH}_4)_2\text{SO}_4 + 2\text{NaOH} \rightarrow \text{Na}_2\text{SO}_4 + 2\text{NH}_3 + 2\text{H}_2\text{O}$
- (d)  $2\text{NH}_3 + \text{H}_2\text{SO}_4 \rightarrow (\text{NH}_4)_2\text{SO}_4$

**iii.** This method is not applicable to compounds containing N in nitro and azo groups, and N present in the ring (e.g., pyridine) as N of these compounds does not change to  $(\text{NH}_4)_2\text{SO}_4$  (ammonium sulphate) under these reaction conditions.

20. 0.30 gm of an organic compound gave 50 ml of nitrogen collected at 300K and 715 mm pressure in Dumas method. Calculate the percentage of nitrogen in the compound. (Vapour pressure of water or aqueous tension of water at 300K is 15 mm.)  
(A) 10.2 (B) 17.46 (C) 24 (D) 34

21. 0.50 gm of an organic compound was treated according to Kjeldahl's method. The ammonia evolved was absorbed in 50 ml of 0.5M  $\text{H}_2\text{SO}_4$ . The residual acid required 60 ml of M/2 NaOH solution. Find the percentage of nitrogen in the compound.  
(A) 50 (B) 56.0 (C) 66 (D) 40
22. 0.4 gm of an organic compound was treated according to Kjeldahl's method. The ammonia evolved was absorbed in 50 ml of 0.5M  $\text{H}_3\text{PO}_3$ . The residual acid required 30 ml of 0.5M  $\text{Ca}(\text{OH})_2$ . Find the percentage of  $\text{N}_2$  in the compound.  
(A) 20 (B) 50 (C) 70 (D) 90
23. 0.002 gm of an organic compound was treated according to Kjeldahl's method.  $0.2 \times 10^{-4}$  mol of  $\text{H}_2\text{SO}_4$  was required to neutralise  $\text{NH}_3$ . Calculate the percentage of  $\text{N}_2$ .  
(A) 50 (B) 28 (C) 70 (D) 18

**COMPREHENSION 24 TO 27**

A 10 ml mixture of  $\text{N}_2$ , Alkane &  $\text{O}_2$  undergo combustion in Eudiometry tube. There was contraction of 2 ml, when residual gases are passed through KOH. To the remaining mixture comprising of only one gas excess  $\text{H}_2$  was added & after reaction the gas produced is absorbed by water, causing a reduction in volume of 8 ml.

24. Gas produced after introduction of  $\text{H}_2$  in the mixture?  
(A)  $\text{H}_2\text{O}$  (B)  $\text{CH}_4$  (C)  $\text{CO}_2$  (D)  $\text{NH}_3$
25. Volume of  $\text{N}_2$  present in the mixture?  
(A) 2 ml (B) 4 ml (C) 6 ml (D) 8 ml
26. Volume of  $\text{O}_2$  remained after the first combustion?  
(A) 4 ml (B) 2 ml (C) 0 (D) 8 ml
27. Identify the hydrocarbon.  
(A)  $\text{CH}_4$  (B)  $\text{C}_2\text{H}_6$  (C)  $\text{C}_3\text{H}_8$  (D)  $\text{C}_4\text{H}_{10}$

## EXERCISE # (JEE-MAINS)

- 6.02  $\times 10^{21}$  molecules of urea are present in 100 ml of its solution. The concentration of urea solution is  
[AIEEE-2004]  
(1) 0.001 M (2) 0.01 M (3) 0.02 M (4) 0.1 M
- A 5.2 molal aqueous solution of methyl alcohol,  $\text{CH}_3\text{OH}$ , is supplied. What is the mole fraction of methyl alcohol in the solution ?  
[AIEEE-2011]  
(1) 0.086 (2) 0.050 (3) 0.100 (4) 0.190
- The concentrated sulphuric acid that is peddled commercially is 95%  $\text{H}_2\text{SO}_4$  by weight. If the density of this commercial acid is  $1.834 \text{ g cm}^{-3}$ , the molarity of this solution is :—  
[AIEEE-2012]  
(1) 17.8 M (2) 15.7 M (3) 10.5 M (4) 12.0 M
- The density of a solution prepared by dissolving 120 g of urea (mol. mass = 60 u) in 1000 g of water is  $1.15 \text{ g/mL}$ . The molarity of this solution is  
[AIEEE-2012]  
(1) 2.05 M (2) 0.50 M (3) 1.78 M (4) 1.02 M
- 10 mL of 2(M) NaOH solution is added to 200 mL of 0.5 (M) of NaOH solution. What is the final concentration ?  
[JEE(Main-online)-2013]  
(1) 0.57 M (2) 5.7 M (3) 11.4 M (4) 1.14 M
- The density of 3M solution of sodium chloride is  $1.252 \text{ g mL}^{-1}$ . The molality of the solution will be (molar mass,  $\text{NaCl} = 58.5 \text{ g mol}^{-1}$ )  
[JEE(Main-online)-2013]  
(1) 2.18 m (2) 3.00 m (3) 2.60 m (4) 2.79 m
- The amount of  $\text{BaSO}_4$  formed upon mixing 100 mL of 20.8%  $\text{BaCl}_2$  solution with 50 mL of 9.8%  $\text{H}_2\text{SO}_4$  solution will be :  
[JEE(Main-online)-2014]  
(Ba = 137, Cl = 35.5, S=32, H = 1 and O = 16)  
(1) 33.2 g (2) 11.65 g (3) 23.3 g (4) 30.6 g
- For the estimation of nitrogen, 1.4 g of an organic compound was digested by Kjeldahl method and the evolved ammonia was absorbed in 60 mL of sulphuric acid. The unreacted acid required 20 mL of sodium hydroxide for complete neutralization. The percentage of nitrogen in the compound is :  
[JEE(Main-online)-2014]  
(1) 3% (2) 5% (3) 6% (4) 10%
- 3g of activated charcoal was added to 50 mL of acetic acid solution (0.06N) in a flask. After an hour it was filtered and the strength of the filtrate was found to be 0.042N. The amount of acetic acid adsorbed (per gram of charcoal) is:  
[JEE(Main)-2015]  
(1) 18 mg (2) 36 mg (3) 42 mg (4) 54 mg

10. On treatment of 100 mL of 0.1 M solution of  $\text{CoCl}_3 \cdot 6\text{H}_2\text{O}$  with excess  $\text{AgNO}_3$ ;  $1.2 \times 10^{22}$  ions are precipitated. The complex is : [JEE(Main)-2017]  
 (1)  $[\text{Co}(\text{H}_2\text{O})_4\text{Cl}_2]\text{Cl} \cdot 2\text{H}_2\text{O}$  (2)  $[\text{Co}(\text{H}_2\text{O})_3\text{Cl}_3] \cdot 3\text{H}_2\text{O}$   
 (3)  $[\text{Co}(\text{H}_2\text{O})_6]\text{Cl}_3$  (4)  $[\text{Co}(\text{H}_2\text{O})_5\text{Cl}]\text{Cl}_2 \cdot \text{H}_2\text{O}$
11. The mole fraction of a solvent in aqueous solution of a solute is 0.8. The molality (in  $\text{mol kg}^{-1}$ ) of the aqueous solution is: [JEE(Main)-April 2019]  
 (1)  $13.88 \times 10^{-1}$  (2)  $13.88 \times 10^{-3}$  (3)  $13.88 \times 10^{-2}$  (4) 13.88
12. What would be the molality of 20% (mass/mass) aqueous solution of KI ? [JEE(Main)-April 2019]  
 (molar mass of KI =  $166 \text{ g mol}^{-1}$ )  
 (1) 1.48 (2) 1.35 (3) 1.08 (4) 1.51
13. The strength of 11.2 volume solution of  $\text{H}_2\text{O}_2$  is : [JEE(Main)-April 2019]  
 [Given that molar mass of H =  $1 \text{ g mol}^{-1}$  and O =  $16 \text{ g mol}^{-1}$ ]  
 (1) 3.4% (2) 34% (3) 1.7% (4) 13.6%
14. The volume strength of 1M  $\text{H}_2\text{O}_2$  is: [JEE(Main)-January 2019]  
 (Molar mass of  $\text{H}_2\text{O}_2$  =  $34 \text{ g mol}^{-1}$ )  
 (1) 16.8 (2) 11.35 (3) 22.4 (4) 5.6
15. 8g of NaOH is dissolved in 18g of  $\text{H}_2\text{O}$ . Mole fraction of NaOH in solution and molality (in  $\text{mol kg}^{-1}$ ) of the solutions respectively are : [JEE(Main)-January 2019]  
 (1) 0.2, 22.20 (2) 0.167, 22.20 (3) 0.167, 11.11 (4) 0.2, 11.11
16. The amount of sugar ( $\text{C}_{12}\text{H}_{22}\text{O}_{11}$ ) required to prepare 2 L of its 0.1 M aqueous solution is : [JEE(Main)-January 2019]  
 (1) 136.8 g (2) 68.4 g (3) 17.1 g (4) 34.2 g
17. A solution of sodium sulfate contains 92 g of  $\text{Na}^+$  ions per kilogram of water. The molality of  $\text{Na}^+$  ions in that solution in  $\text{mol kg}^{-1}$  is: [JEE(Main)-January 2019]  
 (1) 16 (2) 8 (3) 4 (4) 12

## EXERCISE # (JEE-ADVANCED)

- At 100° C and 1 atmp , if the density of liquid water is  $1.0 \text{ g cm}^{-3}$  and that of water vapour is  $0.0006 \text{ g cm}^{-3}$  , then the volume occupied by water molecules in 1 L of steam at that temperature is :  
(A)  $6 \text{ cm}^3$  (B)  $60 \text{ cm}^3$  [JEE '2001]  
(C)  $0.6 \text{ cm}^3$  (D)  $0.06 \text{ cm}^3$
- Calculate the molarity of pure water using its density to be  $1000 \text{ kg m}^{-3}$ . [JEE'2003]
- One gm of charcoal absorbs 100 ml 0.5 M  $\text{CH}_3\text{COOH}$  to form a monolayer, and thereby the molarity of  $\text{CH}_3\text{COOH}$  reduces to 0.49. Calculate the surface area of the charcoal adsorbed by each molecule of acetic acid. Surface area of charcoal =  $3.01 \times 10^2 \text{ m}^2/\text{gm}$ . [JEE'2003]
- 20% surface sites have adsorbed  $\text{N}_2$ . On heating  $\text{N}_2$  gas evolved from sites and were collected at 0.001 atm and 298 K in a container of volume is  $2.46 \text{ cm}^3$ . Density of surface sites is  $6.023 \times 10^{14} / \text{cm}^2$  and surface area is  $1000 \text{ cm}^2$ , find out the no. of surface sites occupied per molecule of  $\text{N}_2$ . [JEE 2005]
- Given that the abundances of isotopes  $^{54}\text{Fe}$ ,  $^{56}\text{Fe}$  and  $^{57}\text{Fe}$  are 5%, 90% and 5%, respectively, the atomic mass of Fe is : [JEE 2009]  
(A) 55.85 (B) 55.95 (C) 55.75 (D) 56.05
- Silver (atomic weight =  $108 \text{ g mol}^{-1}$ ) has a density of  $10.5 \text{ g cm}^{-3}$ . The number of silver atoms on a surface of area  $10^{-12} \text{ m}^2$  can be expressed in scientific notation as  $y \times 10^x$ . The value of x is - [JEE 2010]
- Dissolving 120 g of urea (mol. wt. 60) in 1000 g of water gave a solution of density  $1.15 \text{ g/mL}$ . The molarity of the solution is [JEE 2011]  
(A) 1.78 M (B) 2.00 M (C) 2.05 M (D) 2.22 M
- A compound  $\text{H}_2\text{X}$  with molar weight of 80 g is dissolved in a solvent having density of  $0.4 \text{ g /ml}$ , Assuming no change in volume upon dissolution, the molality of a 3.2 molar solution is. [JEE 2014]
- The mole fraction of a solute in a solution is 0.1. At 298 K, molarity of this solution is the same as its molality. Density of this solution at 298 K is  $2.0 \text{ g cm}^{-3}$ . The ratio of the molecular weights of the solute and solvent, is : [JEE 2016]
- The mole fraction of urea in an aqueous urea solution containing 900 g of water is 0.05. If the density of the solution is  $1.2 \text{ g cm}^{-3}$ , the molarity of urea solution is \_\_\_\_  
(Given data : Molar masses of urea and water are  $60 \text{ g mol}^{-1}$  and  $18 \text{ g mol}^{-1}$ , respectively) [JEE 2019]
