

- ⇒ Trivalent
- ⇒ Incomplete octet
- ⇒ highly unstable
- ⇒ highly reactive
- ⇒ having VO (vacant orbital)

- ⇒ Lewis Acid
- ⇒ formed by heterolytic fission
- ⇒ usually formed in polar solvent
- ⇒ only 6 electrons.
- ⇒ $BP = 3$

$$VP = 0$$

$$LP = 0$$

$$MM = 0$$

$$SM = 2|S| + 1$$

$$= 1$$

Simple

Incomplete

sp^2 hybrid

trigonal planar ⇒ $BP = 3$

$$BA = 120^\circ$$

$$\Rightarrow MM = \checkmark$$

$$\Rightarrow SM = \checkmark$$

$$\Rightarrow \checkmark$$

⇒ Complete Octet

$$\Rightarrow \checkmark$$

$$\Rightarrow \checkmark$$

⇒ No V.O

⇒ Lewis Base

$$SM = 2|S| + 1$$

$$= 1$$

\Rightarrow only 8 e's

$$LP = 1$$

$$\Rightarrow VP = \checkmark$$

$$\Rightarrow sp^3$$

⇒ pyramidal

$$\Rightarrow BA = 107^\circ$$

Induction

⇒ Permanent displacement of σ e⁻s & partial charges induced on carbon of entire carbon chain is due to induction phenomenon of En atom (-E) due to its

$$(*) \quad \Delta x > \Delta x_1 > \Delta x_2 > \Delta x_3$$

$$(*) \quad \delta > \delta_1 > \delta_2 > \delta_3 > \delta_4$$

$$(*) \quad \delta = \delta_1 + \delta_2 + \delta_3 + \delta_4$$

Effect caused due to induction phenomenon of F
in entire compound is known as Inductive (I)
Effect of F atom.

Note (i) Permanent effect

(ii) Effect is applicable only on σ e's

(iii) distance dependent effect

(iv) effect \downarrow as distance increases with A/group

(v) electron displacement in I effect takes

place within Bonding orbital.

(vi) >C-H Bond is taken as a reference.

(vii) I effect is weak effect because sigma bonds are stronger bonds.

Types of I effect

⇒ There are two types of Inductive (I) effect

(1) -Inductive effect (-I effect) when rate of attraction of Bonding e^- pair by any A/G is higher than rate of attraction pair electron effect shown

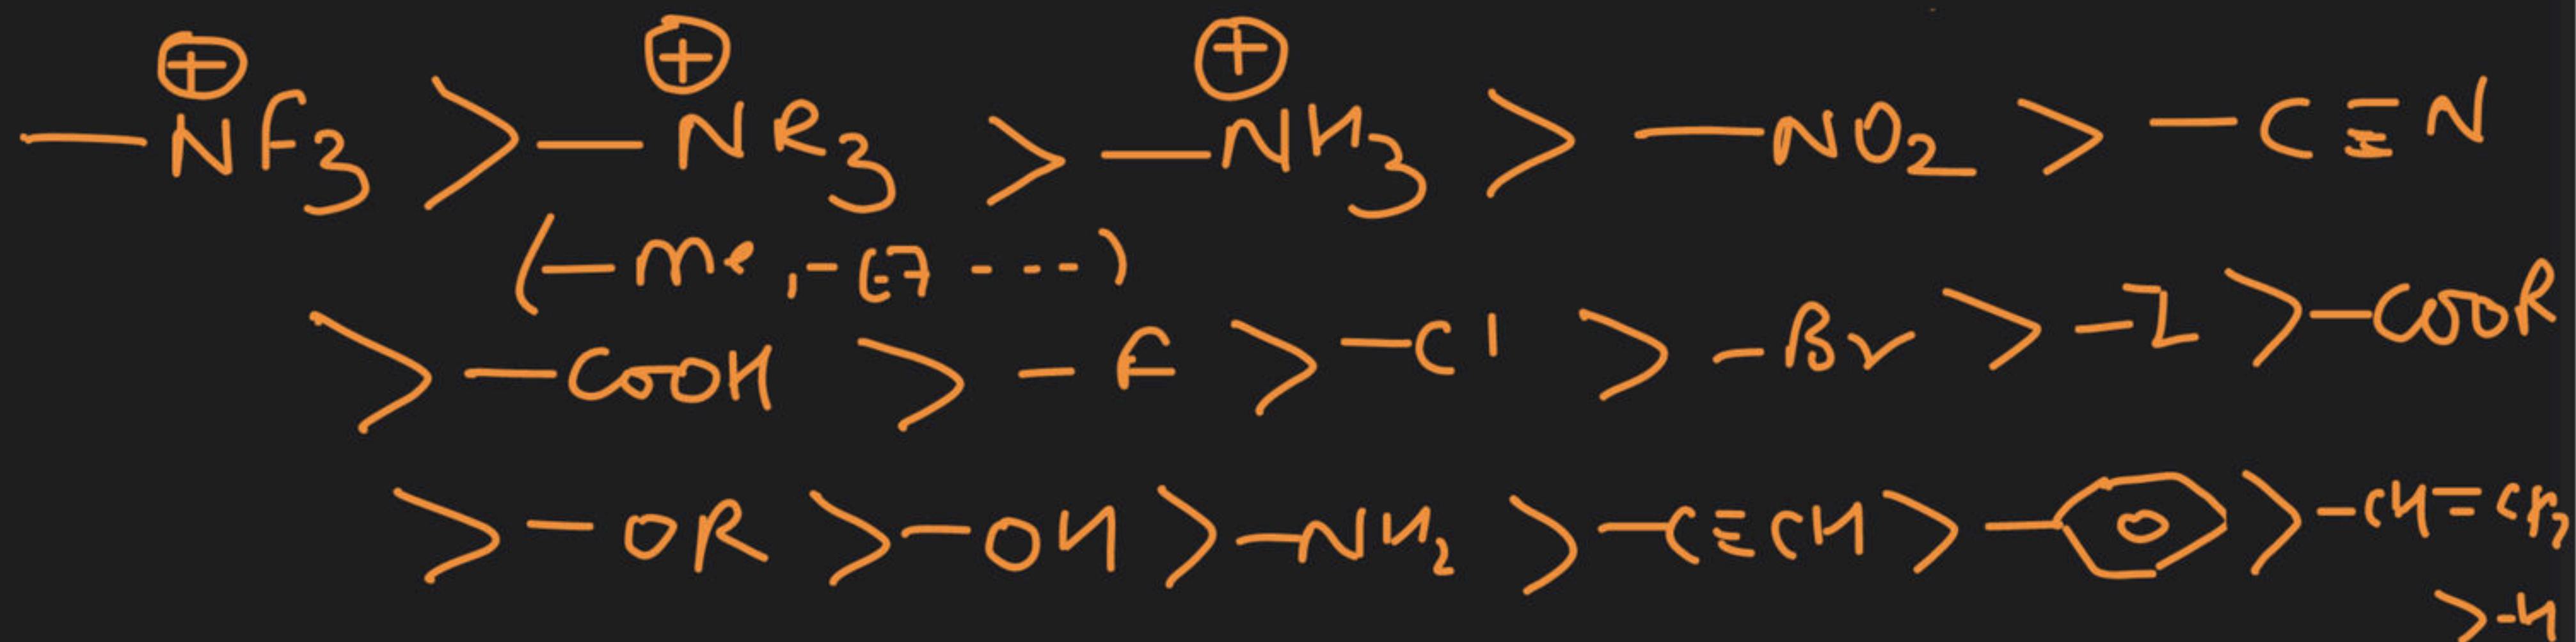

$\chi_{A/G}$

χ_H

of same bond by H atom then is known as -I effect of A/G

$$\boxed{\text{If } \chi_{A/G} > \chi_H \quad (-I \text{ effect by A/G})}$$

-I series: decreasing order of Electronegativity
of atom/groups.

+I effect!!
If $\gamma_{A/G} < \gamma_H$ (+I effect by A/G)

~~DIY~~ (-I)

+I Series

Note (i) $-I$ atom & groups are electron withdrawing in nature.

(ii) $+I$ _____ donating in nature.

Ex: Arrange following in \downarrow order of I effect

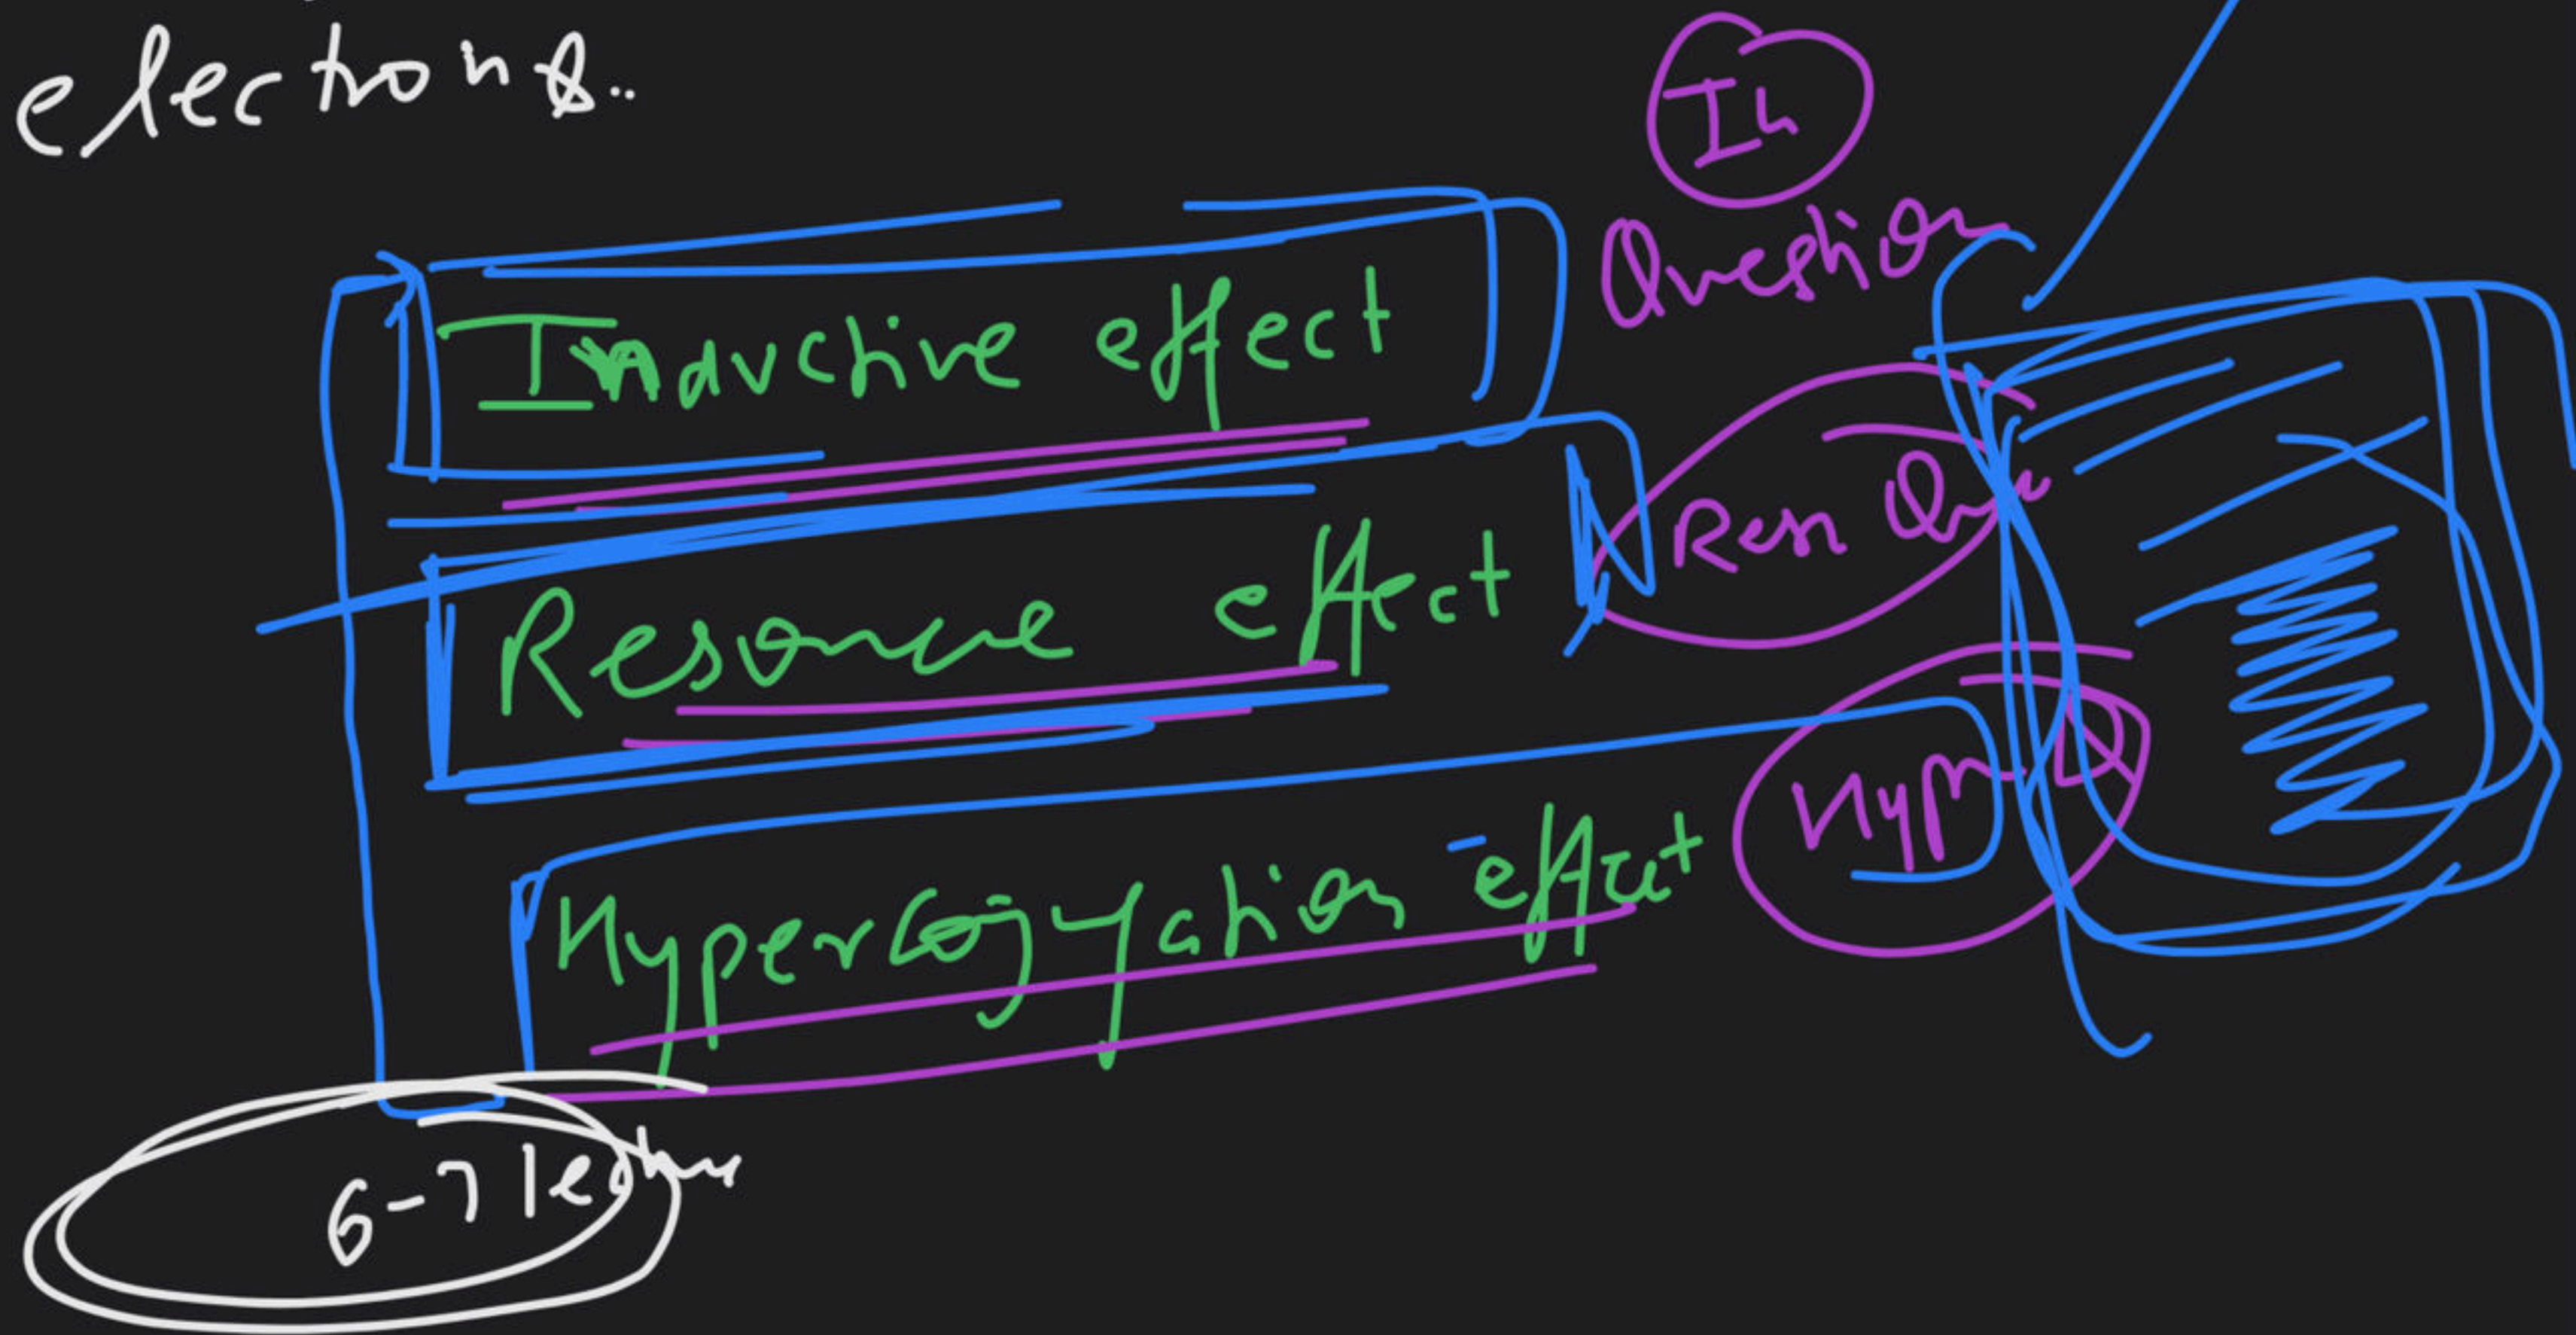

(1) $-F$, $-Cl$, $-Br$, $-I$ ($-I$ effect)

(2) $-CF_3$, $-CCl_3$, $-CBr_3$, $-CI_3$ ($-I$ effect)

(3) $-CH_2-CH_3$ $-CH_3$ ($+I$ effect)

(9) Explain why I effect is applicable on σ Bond electrons.

(231) (1,2)(3,4) Diepoxy cyclohexane

(231)

(3,5) Epoxy hept-3-ene

(233)

(2,3)(5,6) Di Epoxy-4-hydroxy
Cyclohexanone.

- (235) Propane - 1,2,3-Tri Carbonyl (An
 (236) Carbonitrile
 (237) Carb aldehy
 (238) - Carbonyl chloride
 (239) Carboxamide

(1,5) Epoxyl - 2-ethoxy - 1,3,4,5-pentamethoxy
 pentane.
